A Headache With Virtually No Headache Pain?

Any individual affected by migraine can certainly experience a variety of [migraine symptoms](#) that could be quickly identified. Having said that, sometimes, pain just isn't one of them. Nevertheless they do respond positively to drugs for instance [Excedrin migraine](#) and got far better. This informative article offer you quite a few observations into this scenario.

How would you react if someone informed you that you were suffering from a headache when you were aware that you had not had any headache pain? Nevertheless, concurrently you additionally were aware that you had suffered a number of pretty odd symptoms that you just were experiencing difficulty getting diagnosed. If you are troubled with some odd unexplained symptoms it's possible you'll essentially be afflicted with what is generally identified as a silent migraine. It is recognized by numerous other names also. It has not long ago been given the name of migraine aura without having a headache, in contrast to various other occasions it has been referred to as ocular migraine or painless migraine.

The indications of this kind of non-headache headaches are like those a person may well get at the beginning of a migraine, although they never get the accompanying headache pain. A person might have got the visual symptoms for example experiencing flashing lights on to one side, feeling light headed, or perhaps experiencing tingling or numbness in one's fingers. Sometimes men and women even have trouble speaking, or perhaps experience pain in peculiar areas on their faces. These peculiar symptoms are often found in woman rather than men, somewhat later in life.

The main challenge with this odd condition is the fact that these kinds of symptoms can certainly turn out to be mistaken for other problems. Without being able to convey to a physician that there's headache pain it is not easy to have a accurate prognosis with this condition.

For example, the symptoms are rather similar to those of stroke indications. Various men and women have been misdiagnosed simply because doctors reckoned their patient could possibly have experienced a minor stroke instead. These symptoms might in addition be attributed to seizures as well as significant visual troubles. With all these more evident possibilities it is really not a surprise that medical doctors take a look at these to begin with. You should allow your health care provider to complete whatever tests they think are important to eliminate the more serious health issues. Just in case one of these is the issue you really need to be certain. They may possibly perform a CT scan, an MRI, may order blood tests to be taken and very likely would like an eye examination. Once these assessments are done and everything comes back negative its time to lead your doctor in a different direction. The right way to encourage them to take on a serious look at the possibility of a silent migraine to become the main cause of your symptoms is to explain your family history to begin with. Nearly all migraine sufferers have other members of their immediate family who also get migraine headaches. Then carefully discuss your symptoms, once more, and demonstrate to them that they resemble those involving migraine. If perhaps you've had these types of episodes a couple of times that really should in addition help to convincing them that you're certainly experiencing migraine symptoms while not the headache pain.

You are able to take one of the drugs which have been employed in standard migraine treatment. This includes the drugs a number of men and women use to try to protect against a migraine from coming once the aura has begun. Injectibles as well as nasal sprays are more effective to make use of simply because they are generally fast acting.
