# **In What Stages Of Cancer Of The Bowel Can The Survival Rate Be Bettered**

A diagnosis of Colon Cancer doesn't actually mean the survival of this illness is dark vs other types of Cancer. If cancer of the bowel is caught early while it's in the first stage there is a 93% survival rate. While Cancer in any form is very serious, Colon Cancer is basically one of the easiest to triumph over.

In some instances, removing the diseased section of the gut cures the carcinoma and chemotherapy or radiation may not be needed. Growth location aids in determining survival rates. For instance, if the tumor is found in the ascending colon, which is closest to the small intestine, is roughly 63%. [Colon Cancer Survival Rates](#)

The cross colon, along the middle, survival rates are approximately 59% while the descending colon, that which is closest to the anus is 66%. This rating system is based on a 5 year average, meaning the amount of patients still alive 5 years after diagnosis.

Survival rates are also determined by what country the patient lives. In Europe, the rate is 43% and in America it is 62%. These statistical data, however, could be influenced by the quality of care received.

Stages of the illness are decided by the scale of the disease, if it has spread thru the gut walls and / or other organs or lymph nodes. There are two types of staging, which is the method to pinpoint the type of cancer. The clinical stage will be performed by the consultant with blood tests, biopsies and mris. The pathologic stage is decided by the consultant, as in surgery, to get a visual notion of the extent and sort of cancer.

Having regular colonoscopies ( the pre-screening process ) are crucial in catching the illness early. Sometimes a colonoscopy is commended annual for individuals 40 and over if there is a history of the disease, either in the patient or blood related family, the doctor may recommend pre-screening more frequently.

Some studies also show that exercising and diet can play a vital role in stopping bowel cancer.
